For Varnishing: Coupling 03-005

The self-locking couplings of the type 03-005 are developed especially for challenging liquids in varnish or paint processing industries like automotive, wood processing, engineering, repair or paint workshops to connect paint spray guns. The demands of the users for squirt-free, ergonomic and simple handling is met with a special valve technology and a bayonet locking. The function-related residual leakage during the disconnection is minimized due to an easy-to-clean ball valve. Furthermore, the valve can be cleaned easily. Thus, the coupling is perfectly suitable when it comes to handle paints and coatings based on synthetic resin, nitro and water.

The couplings of the type 03-005 are manufactured of high-quality materials as standard. On request a design in complete stainless steel is available. Of course, every coupling is free of enamel flow disturbing substances, no matter which design you choose.
